At form time step 2, because of the better results, he uses the 2nd batch of gradients as the input of the 3rd step as the cost function is better optimized. I'd like to use the 2nd batch of gradients as the cost function of step 2 only. Any idea how to do it? Or should I re-train the network multiple times to achieve this? Thank you. A: The reason why you don't want to train your network twice is because of how the optimization functions work: If you are using SGD or ADAM, or any other gradient descent optimization methods, your loss values will decrease as the cost function is better optimized. Also, if you have a batch size of two you are going to experience the issues you are having, because the network will get biased due to the batch size and just get stuck in a local minima. You would want to use a strategy similar to this: Train a first time using a batch size of 10 get a loss value Stop the training and save the weights. Train for another time using a batch size of two. Increase the batch size. Repeat step 2 and 3 (e.g. 50 times) pone.0139490.ref005]\]. Our results, although preliminary, suggest that it will be difficult to detect the presence of a disease in a particular patient from the information in the question alone, and if we might be able to evaluate the risk of a disease for a particular patient in this manner, the value of the information may be more easily accepted. If we could have a screening method with a high sensitivity to detect the presence of colon cancer at the preclinical phase, the value of questionnaires may be improved, and early detection and prevention of colon cancer may also be possible. The results of this study must be interpreted with caution because the data were obtained from only 40 patients. However, considering the size of the patient cohort in this study (n = 20, mean age = 60.1 ± 7.9 years), this patient cohort is definitely large enough. When the results of our study were reviewed, we observed that the mean distance between each patient's bedroom and toilets was 5.0 ± 1.3 m. In Japan, access to toilets is usually easy, and many toilets are located outdoors. Thus, many patients in this study may have been able to detect the presence of a gas emission simply by walking around their
