It seems like a very simple and logical statement, but there are a few points which do not apply to practice. There are four of these points which I believe can help to explain the difference. 1. Measuring without change There are some projects that are set up in such a way that as you are measuring you are not changing things. This can lead to a false sense of control. If someone says to me ‘you can’t tell me anything about this project because you can’t tell me anything about the way it will change’, I will nod understandingly and say ‘yeah, I know.’ The problem is that these people would be able to tell you precisely how a project will change, because they know exactly what will

happen. 2. Measuring without impact The idea that you can measure without changing things is interesting. But the flip side is that you can't measure without changing things. The key difference between these two statements is that in one case you are looking at the change that will happen, and in the other you are looking at the impact of the change. 3. Measuring without progress One of the most common issues I see with projects is that people are not setting objectives. This is not so much an issue of having no goals, but more so about having no idea what progress will be made. This is a very big problem and it is a1d647c40b
