How to make a more compact CAD design How to make a more compact CAD design by using degree symbol to represent degree.1. Field of the Invention The present invention relates to a method of controlling an access control system for a computerized storage system, which protects data stored in a disk and allows only users having right to access to that data to access it. 2. Description of the Related Art FIG. 1 shows a conventional system wherein when a host computer 101 sends a write request to a disk 102, access control is carried out so that access is allowed only to a group of authorized users. As shown in FIG. 1, the system includes access control tables 104(1) to 104(n) for a group of users and a disk 102 for storing data of the users. A user authentication section 103 generates a user ID for every user. A disk 102 for storing data of a group of users and an access control table 104(i) for protecting data of

a group of users are collectively referred to as a disk group 102. The access control table 104(i) comprises a plurality of address bits. These address bits are used as identifier of access control information. A virtual address of a file as it is stored in a disk is a combination of an access control bit and an address bit. When access control is carried out by comparing a received virtual address with the access control table, the access control bit enables access of a user to that file. When a user wants to access that file, the user specifies an address bit in the received virtual address by issuing an access control bit designation request to a disk 102, and then sends a write request to the disk 102. The received write request is compared with a data stored in the disk 102, whereupon access to the file is permitted or not. If access is permitted, the data of the file is sent to the host computer 101 as a reply to the write request. However, the conventional method for access control has a problem in that when access control is to be done on a file being accessed, all files must be accessed in a sequential order. For example, if an active user asks for access to a file, the file must be accessed in an order from the beginning of the file. If access to a certain file is being done and a new request for access to a file is issued, access to a subsequent file

cannot be made. Further, the conventional method is not able to change access control information of a file during access to that file.
