Field of the Invention The present invention relates to heat exchangers and particularly to a heat exchanger which includes a stack of thin tubes through which a heat-transfer liquid flows and which is in thermal contact with a heat-transfer solid. 2. The Related Art Heat exchangers, especially those associated with electric power generating and transmitting systems, are required to perform in a wide range of ambient conditions. For instance, the heat exchangers used to transfer heat from one fluid to another in a nuclear power plant or other heat exchange system may be exposed to extremely cold as well as extremely hot ambient conditions. Such heat exchangers include stacks of metal tubes through which a heat-transfer liquid flows and which are in thermal contact with heat-transfer solids, such as metal plates or plates made of other materials. The primary purpose of the metal tubes in such heat exchangers is to provide support for the heat-transfer solids and to distribute heat from the heat-transfer liquid to the heat-transfer solids and then ultimately to the ambient air. Because metal tubes are not good heat conductors, when the ambient air temperature is low, heat transfer between the metal tubes and the

heat-transfer liquid does not occur efficiently, while at the same time heat transfer between the heat-transfer liquid and the heat-transfer solid (e.g., the metal plates) is relatively poor. The heat transfer from the liquid to the metal tubes becomes even less efficient at high ambient temperatures, which are common at the typical location of a heat exchanger in an electric power plant. Accordingly, the life of a heat exchanger becomes shorter as the ambient temperature increases. One solution to the problems associated with low efficiency of heat transfer from metal tubes to heat-transfer liquids and poor efficiency of heat transfer from heat-transfer liquids to heat-transfer solids has been to use the heat transfer medium of the heat exchanger (i.e., the heat-transfer liquid) to provide a forced convection heat transfer between the metal tubes and the ambient air. When forced convection is used to transfer heat from the metal tubes to the ambient air, however, temperature differentials at the entrance and exit of 6d1f23a050
